

AFTS · FOOD SAFETY VALIDATION INTELLIGENCE

Pathogen Surveillance · Week 14

AI-powered analysis of 13 regulatory recall actions across 9 jurisdictions, aggregated from 66 primary sources monitored continuously by the AFTS intelligence platform.

TOTAL RECALLS 13 ▼ -9 (-41%) vs prior week	TIER-1 CRITICAL 8 Immediate public-health risk	ACTIVE OUTBREAKS 1 Confirmed cluster events	LEADING PATHOGEN Listeria monocytogenes 6 cases · 46% of total
---	---	--	---

§ 01 Intelligence Analysis

This week produced 13 pathogen-related recall incidents across the AFTS monitoring network, with 8 classified as Tier-1 and 1 confirmed outbreak event(s). *Listeria monocytogenes* dominated the surveillance window, accounting for 6 of 13 incidents (46%). The elevated Tier-1 ratio indicates sustained regulatory pressure and should be read by food manufacturers as a signal of tightening enforcement.

Listeria monocytogenes at this prevalence points to post-process recontamination in ready-to-eat lines rather than thermal underprocess. The likely failure modes are environmental harbourage, sanitation SOP drift, and post-lethality recontamination.

Regulatory activity this week spanned multiple jurisdictions, signalling continued inspection intensity. AFTS recommends that food manufacturers use this briefing as a prompt to re-verify the single highest-leverage control for their commodity this week.

PROCESS AUTHORITY NOTE: This window contains 1 incident(s) implicating *Clostridium* or botulinum toxin, with Tops Friendly Markets (United States) cited for *Clostridium botulinum*. Any shelf-stable low-acid, acidified, aseptic/UHT, hot-filled, or reduced-oxygen-packaged product in the affected category must be reviewed to confirm the scheduled thermal process under a qualified process authority — required under FDA 21 CFR 113/114, EU Reg. 852/2004, CFIA SFCR, FSANZ Food Standards Code Ch. 3, and Japan’s Food Sanitation Act. Typical compliance gaps: unfiled or outdated scheduled process, deviation resolved without qualified review, container or seal-integrity lapse, or a formulation change (pH, a_w, salt, preservative) not re-evaluated. A Tier-1 / Class-I classification on a product of this class reliably triggers a process-filing audit and regulatory citations in every major jurisdiction.

§ 02

Top 5 Critical Threats

Ranked by pathogen severity (*C. botulinum* → *Listeria* → STEC → *Salmonella*), outbreak status, and tier classification. Each row links to the originating regulatory notice.

#	DATE	PATHOGEN	COMPANY / BRAND	PRODUCT	JURISDICTION & SOURCE

Process authority. Analytical frameworks, severity rubrics, pathogen classification, and the engineering interpretation of each recall are developed under the process authority of AFTS, drawing on in-house expertise in food process engineering, thermal processing, and regulatory compliance. Every view is grounded in validated process engineering: thermal processing (21 CFR 113/114), pasteurisation (PMO), aseptic and UHT, hold-tube and F-value lethality, and HACCP. This is what the AFTS platform brings that pure data feeds do not — data under engineering authority.

Data & AI pipeline. The system aggregates regulatory recall notices from 66 primary sources across 60+ countries (FDA, USDA FSIS, RASFF, FSA, FSANZ, CFIA, RappelConso, BVL, AESAN, EFET, and national authorities) and processes each record through Gemini (extraction), OpenAI GPT (normalisation), and Claude (Tier-1 validation). Records are de-duplicated and harmonised into the accumulative dataset.

This briefing. Statistical analysis filters the accumulative dataset to the reporting week (28 Mar – 3 Apr 2026). AI-generated narrative is produced against AFTS process-authority prompts and edited for publication. Figures and pathogen names are preserved verbatim from source data.
