§ 01

Intelligence  
Analysis

April 2026 produced 236 pathogen-related recall incidents across the AFTS monitoring network, a 219% move above the prior month — the rolling baseline is too narrow for a Z estimate this early in the series. *Listeria monocytogenes* dominated with 146 of 236 incidents (62%). The composite severity index closed at 52.2/100 (elevated), with 198 Tier-1 critical events and 6 outbreak clusters on record. The standout hotspot was Canada × *Salmonella* spp., with 6 recalls against an independence-baseline expectation of 1.7 (stdres +3.30).

Structurally, the month reads as with mixed signal concentration (Source HHI None, Geographic Gini None). For a *Listeria monocytogenes*-dominated month, the relevant failure modes are post-process environmental harbourage in Zone 1 of RTE lines,

sanitation SOP drift, and cold-chain lapses — not thermal underprocess. The Tier-1 intensity ratio of Nonex vs the rolling baseline indicates severity is in line.

Looking forward, operators in *Listeria monocytogenes*-relevant commodity categories should re-verify the single highest-leverage control this month: environmental monitoring swab frequency on RTE deli and dairy lines, or pasteurisation D-value validation on low-moisture commodities, whichever matches their product mix. The linear-trend projection for next month stands at 258 recalls (95% CI [76, 441]), with  $r^2=0.763$ . Documentation packages should be ready for rapid regulatory response given continued inspection intensity.

**PROCESS AUTHORITY NOTE:** This window includes *Clostridium botulinum* or botulism-relevant recalls — a hazard category for which scheduled-process adequacy is a mandatory regulatory requirement, not a recommended best practice. Across global jurisdictions — FDA (21 CFR 113/114), EU (Reg. 852/2004 and 2073/2005, with RASFF/EFSA oversight), CFIA (Safe Food for Canadians Regulations), FSA / FSS in the UK, FSANZ in Australia and New Zealand, and MHLW in Japan — the common principle is that low-acid, aseptic, and commercially sterile products require a scheduled process established by a qualified process authority and executed under documented GMP oversight. Recall events in this category most commonly trace to an unfiled or outdated scheduled process, a process deviation resolved without qualified review, or a formulation or packaging change introduced without process re-evaluation. Manufacturers producing low-acid canned, acidified, fermented, or anaerobically packaged products should confirm with a qualified process authority that filings, GMP programmes, and deviation handling remain current before any production change.

### HOTSPOT ALERTS

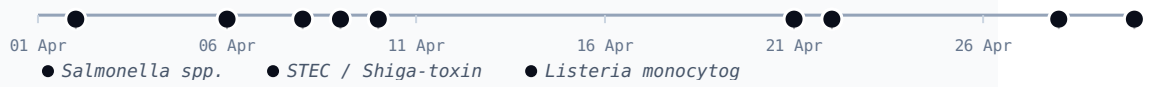

**Canada** × *Salmonella spp.*: 6 recalls observed vs 1.7 expected under independence ( $\sigma = +3.30$ , 3.53× expected)

**Germany** × *Salmonella spp.*: 4 recalls observed vs 1.31 expected under independence ( $\sigma = +2.35$ , 3.06× expected)

§ 05

## Outbreak Timeline & Cluster Analysis

One marker per outbreak event; hover/print for detail. Clusters are  $\geq 3$  same-pathogen outbreaks within a 14-day window.

#### DETECTED CLUSTERS (2)

*Salmonella* spp. — **4 events** in 4 days across Brazil, Canada, Taiwan.

*Salmonella* spp. — **4 events** in 7 days across Canada, Ireland, United Kingdom.

## § 06 Regulatory Intensity & Concentration

### SOURCE HHI

23 sources · **highly concentrated** (<1500 diverse · 1500–2500 moderate · >2500 concentrated)

### GEOGRAPHIC GINI

24 countries · **highly concentrated** (<0.4 even · 0.4–0.6 moderate · >0.6 uneven)

### TIER-1 INTENSITY

**n/a**

This month: 0% · baseline: -%

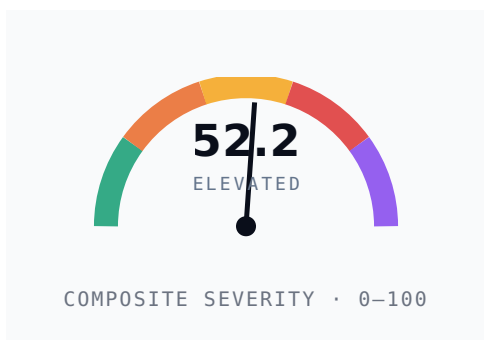

#### ↑ EMERGING PATHOGENS (Z > 2)

*Listeria monocytogenes*: 146 cases, Z=+5.20, MoM +1846%

#### ↓ DECLINING PATHOGENS (Z < -2)

*Salmonella* spp.: 29 cases, Z=-2.10, MoM +55%

## Predictive Outlook

**How to read this panel.** Each card shows a predictive model AFTS runs on the monthly series. Active cards publish a forecast with its confidence envelope; dormant cards show the data threshold required to activate — an honest roadmap as the dataset grows. When  $n$  reaches 12 months, STL decomposition unlocks; 24 months unlocks Holt-Winters, SARIMA, and Prophet. All models run on the same Recalls sheet you already subscribe to — no secondary data required.

### Linear trend projection ACTIVE

OLS on total monthly counts

Next-month forecast: **258** recalls (95% CI [76, 441]); slope **+66.8/month**;  $r^2=0.763$ . Trend is rising; slope is statistically significant.

### Poisson per-pathogen forecast INACTIVE

For rare pathogens (<10 cases/mo)

No pathogen has  $\geq 6$  months of history & rare profile.

### CUSUM change-point detection Activates at $n \geq 6$ months (have 4).

Page-1954 tabular CUSUM

### OLS with seasonal dummies Activates at $n \geq 14$ months (have 4).

Linear trend + month-of-year effects

### STL decomposition STL activates at $n \geq 24$ months (have 4).

Trend + seasonal + residual (LOESS)

### Holt-Winters Holt-Winters activates at $n \geq 24$ months (have 4).

Level + trend + seasonal smoothing

### SARIMA SARIMA activates at $n \geq 24$ months (have 4).

Seasonal ARIMA(p,d,q)(P,D,Q)s

### Prophet Prophet activates at $n \geq 24$ months (have 4).

Additive seasonality + holidays

## Top 10 Critical Incidents

## § 09 Methodology & Sources

**Process authority.** Analytical frameworks, severity rubrics, pathogen classification, and the engineering interpretation of each recall are developed under the process authority of AFTS, drawing on in-house expertise in food process engineering, thermal processing, and regulatory compliance. Every view is grounded in validated process engineering: thermal processing (21 CFR 113/114), pasteurisation (PMO), aseptic and UHT, hold-tube and F-value lethality, and HACCP.

**Statistical methods.** Month-over-month Z-scores use the rolling-prior-months mean and sample standard deviation; the hotspot matrix uses standardised chi-square residuals ( $\sigma > 2$  flags over-representation vs independence); source concentration is quantified via the Herfindahl-Hirschman Index and geographic distribution via the Gini coefficient; outbreak clusters are detected via a sliding 14-day window over same-pathogen events. Predictive models are gated to activate only when data history meets the minimum size required for valid estimation.

**Data & AI pipeline.** The system aggregates regulatory recall notices from 70+ countries and 15+ agencies (FDA, USDA FSIS, RASFF, FSA, FSANZ, CFIA, RappelConso, BVL, AESAN, EFET and national authorities) into the accumulative Recalls sheet. AI narrative is produced against AFTS process-authority prompts and edited for publication. Figures and pathogen names are preserved verbatim from source data.

## Complete Recall Register

Every pathogen-related recall recorded in April 2026, ranked by severity. This appendix replaces the companion page for subscriber convenience.
