§ 01 Intelligence Analysis

Food Safety Analysis Review

This week produced 43 pathogen-related recall incidents across the AFTS monitoring network, with 22 classified as Tier-1 and 1 confirmed outbreak event. *Listeria monocytogenes* dominated the surveillance window, accounting for 12 of 43 incidents (28%). The elevated Tier-1 ratio indicates sustained regulatory pressure and should signal to food manufacturers that enforcement is tightening.

Regulatory activity this week spanned multiple jurisdictions (RappelConso, BVL, BLV, RASFF, FSA, and national authorities), signalling continued inspection intensity. AFTS recommends that food manufacturers use this briefing as a prompt to re-verify the single highest-leverage control for their commodity this week and to confirm that documentation packages are ready for rapid regulatory response.

PROCESS AUTHORITY NOTE: This window contains 12 *Listeria monocytogenes* incidents, with Sans marque (France), Belle Henriette (France), and Patifrais (France) among those cited. Ready-to-eat manufacturers—particularly those producing deli meats, soft cheese and dairy (including raw-milk cheese), charcuterie and cured meats, smoked and cured seafood, cooked meats, refrigerated prepared salads, and cut produce—should review their environmental monitoring programme (EMP), Zone 1–4 sampling plan, and corrective-action triggers under EU Reg. 2073/2005 microbiological criteria (absence in 25 g for RTE infant and medical food; ≤100 CFU/g for other RTE at end of shelf-life), Reg. 852/2004 HACCP, and national RASFF notification obligations. The process-authority deliverable for this hazard class is a validated 6-log *L. monocytogenes* reduction at the kill step (where one exists) or a documented post-lethality control programme where the organism cannot be eliminated in-pack. Typical compliance gaps include incomplete Zone 1 sampling, sanitation SOPs not validated against worst-case soil load, equipment hollows harbouring persistent strains, and post-lethality recontamination pathways not mapped. Tier-1 classification with RTE

product categories routinely triggers an EMP audit and formal inspection-findings issuance by the national competent authority under RASFF.

§ 02 **Top 5 Critical Threats**

Ranked by pathogen severity (*C. botulinum* → *Listeria* → STEC → *Salmonella*), outbreak status, and tier classification. Each row links to the originating regulatory notice.

§ 05 Methodology & Sources

Process authority. Analytical frameworks, severity rubrics, pathogen classification, and the engineering interpretation of each recall are developed under the process authority of AFTS, drawing on in-house expertise in food process engineering, thermal processing, and regulatory compliance. Every view is grounded in validated process engineering: thermal processing (21 CFR 113/114), pasteurisation (PMO), aseptic and UHT, hold-tube and F-value lethality, and HACCP. This is what the AFTS platform brings that pure data feeds do not — data under engineering authority.

Data & AI pipeline. The system aggregates regulatory recall notices from 66 primary sources across 60+ countries (FDA, USDA FSIS, RASFF, FSA, FSANZ, CFIA, RappelConso, BVL, AESAN, EFET, and national authorities) and processes each record through Gemini (extraction), OpenAI GPT (normalisation), and Claude (Tier-1 validation). Records are de-duplicated and harmonised into the accumulative dataset.

This briefing. Statistical analysis filters the accumulative dataset to the reporting week (18 Apr – 24 Apr 2026). AI-generated narrative is produced against AFTS process-authority prompts and edited for publication. Figures and pathogen names are preserved verbatim from source data.
