§ 01 Intelligence Analysis

# Food Safety Analysis – Weekly Pathogen Surveillance Report

This week produced 11 pathogen-related recall incidents across the AFTS monitoring network, with 8 classified as Tier-1 and 1 confirmed outbreak event. *Listeria monocytogenes* dominated the surveillance window, accounting for 5 of 11 incidents (45%). The elevated Tier-1 ratio indicates sustained regulatory pressure and should signal to food manufacturers that enforcement is tightening.

Regulatory activity this week spanned multiple jurisdictions (RappelConso, FDA, CFIA, and national authorities), signalling continued inspection intensity. AFTS recommends that food manufacturers use this briefing to re-verify the single highest-leverage control for their commodity this week and to confirm that documentation packages are ready for rapid regulatory response.

**PROCESS AUTHORITY NOTE:** This window contains 5 *Listeria monocytogenes* incidents, with LE FROMAGER DES HALLES (France) and LES ATELIERS DE SEBASTIEN (France) among those cited. Ready-to-eat manufacturers—particularly those producing deli, soft cheese and dairy (including raw-milk cheese), charcuterie and cured meat, smoked and cured seafood, cooked meat, refrigerated prepared salads, and cut produce—should review their environmental monitoring programme (EMP), Zone 1–4 sampling plan, and corrective-action triggers under EU Reg. 2073/2005 microbiological criteria (absence in 25 g for RTE infant and medical foods; ≤100 CFU/g for other RTE at end of shelf-life), Reg. 852/2004 HACCP, and national RASFF notification obligations. The process authority deliverable for this hazard class is a validated 6-log *L. monocytogenes* reduction at the kill step (where one exists) or a documented post-lethality control programme where the organism cannot be eliminated in-pack. Typical compliance gaps include incomplete Zone 1 sampling, sanitation SOPs not validated against worst-case soil load, equipment hollows harbouring persistent strains, and post-lethality recontamination pathways not mapped. Tier-1 classification with RTE

product categories routinely triggers an EMP audit and formal inspection-findings issuance by the national competent authority under RASFF.

§ 02Top 5 Critical Threats

Ranked by pathogen severity (*C. botulinum* → *Listeria* → STEC → *Salmonella*), outbreak status, and tier classification. Each row links to the originating regulatory notice.

**Process authority.** Analytical frameworks, severity rubrics, pathogen classification, and the engineering interpretation of each recall are developed under the process authority of AFTS, drawing on in-house expertise in food process engineering, thermal processing, and regulatory compliance. Every view is grounded in validated process engineering: thermal processing (21 CFR 113/114), pasteurisation (PMO), aseptic and UHT, hold-tube and F-value lethality, and HACCP. This is what the AFTS platform brings that pure data feeds do not — data under engineering authority.

**Data & AI pipeline.** The system aggregates regulatory recall notices from 66 primary sources across 60+ countries (FDA, USDA FSIS, RASFF, FSA, FSANZ, CFIA, RappelConso, BVL, AESAN, EFET, and national authorities) and processes each record through Gemini (extraction), OpenAI GPT (normalisation), and Claude (Tier-1 validation). Records are de-duplicated and harmonised into the accumulative dataset.

**This briefing.** Statistical analysis filters the accumulative dataset to the reporting week (25 Apr – 1 May 2026). AI-generated narrative is produced against AFTS process-authority prompts and edited for publication. Figures and pathogen names are preserved verbatim from source data.
