§ 01 Intelligence Analysis

Food Safety Analysis – Weekly Briefing

This week produced 28 pathogen-related recall incidents across the AFTS monitoring network, with 19 classified as Tier-1 and 0 confirmed outbreak events. *Listeria monocytogenes* dominated the surveillance window, accounting for 13 of 28 incidents (46%). The elevated Tier-1 ratio indicates sustained regulatory pressure and should signal to food manufacturers a tightening of enforcement activity.

Regulatory activity this week spanned multiple jurisdictions (RappelConso, BLV, SFA, BVL, Italian Ministry of Health, and national authorities), signaling continued inspection intensity. AFTS recommends that food manufacturers use this briefing as a prompt to re-verify the single highest-leverage control for their commodity this week and to confirm that documentation packages are ready for rapid regulatory response.

PROCESS AUTHORITY NOTE: This window contains 2 incidents implicating *Clostridium* or botulinum toxin, with Liquid Blenz Corp (United States) and Marché Rio (Canada) cited for *Clostridium botulinum*. Any shelf-stable, low-acid, acidified, aseptic/UHT, hot-filled, or reduced-oxygen-packaged product in the affected category must be reviewed to confirm that the scheduled thermal process has been established, filed, and validated under the guidance of a qualified process authority—required under FDA 21 CFR 113 (LACF)/21 CFR 114 (acidified foods) with scheduled-process filing under 21 CFR 108 (Form 2541/2541e). Parallel frameworks apply under CFIA Safe Food for Canadians Regulations (SFCR) with Preventive Control Plan (PCP) requirements for low-acid foods. The most common compliance gaps behind recalls of this profile are an unfiled or outdated scheduled process, a process deviation resolved without qualified process authority review, a container or seal-integrity lapse, or a formulation change (pH, a_w, salt, or preservative) introduced without re-evaluation. Tier-1/Class-I classification on a low-acid product reliably

triggers a regulatory process-filing audit by the FDA, USDA FSIS, and CFIA, with formal inspection findings issued on the subsequent visit.

§ 02 **Top 5 Critical Threats**

Ranked by pathogen severity (*C. botulinum* → *Listeria* → STEC → *Salmonella*), outbreak status, and tier classification. Each row links to the originating regulatory notice.

§ 05 Methodology & Sources

Process authority. Analytical frameworks, severity rubrics, pathogen classification, and the engineering interpretation of each recall are developed under the process authority of AFTS, drawing on in-house expertise in food process engineering, thermal processing, and regulatory compliance. Every view is grounded in validated process engineering: thermal processing (21 CFR 113/114), pasteurisation (PMO), aseptic and UHT, hold-tube and F-value lethality, and HACCP. This is what the AFTS platform brings that pure data feeds do not — data under engineering authority.

Data & AI pipeline. The system aggregates regulatory recall notices from 66 primary sources across 60+ countries (FDA, USDA FSIS, RASFF, FSA, FSANZ, CFIA, RappelConso, BVL, AESAN, EFET, and national authorities) and processes each record through Gemini (extraction), OpenAI GPT (normalisation), and Claude (Tier-1 validation). Records are de-duplicated and harmonised into the accumulative dataset.

This briefing. Statistical analysis filters the accumulative dataset to the reporting week (11 Apr – 17 Apr 2026). AI-generated narrative is produced against AFTS process-authority prompts and edited for publication. Figures and pathogen names are preserved verbatim from source data.
